

## **Modern India and its challenges**

- ➔ Technology driven
- ➔ Politics driven
- ➔ Sports driven
- ➔ Brain drain driven
- ➔ Nationalism driven

A short book for accepting these challenges

by  
Kumar Sachin

## Preface

Have you ever thought about a driver? I am not blaming any person. But he is the person who actually gives you a journey and make you to move through a path. You can called him a driver or a leader for a time interval. In the same way we choose someone in our life who might be responsible for selecting your destiny and path of your life. How it happens? Your journey is a part of your life and for how much time your leader is the part of your life decides the destiny in most of the cases. We faith on him for mutual goals. So, Your leader is such a driver who have your powers and can make you feel achiever or looser.

What are the reasons that causing which are keeping India on back foot.

Some of them are:-

## **Technology driven:-**

We are living in the digital era. We find ourselves very much talented in technology. But still how are we far behind from western countries. No one is thinking about sci-fi here. Is there only to get livelihood is our need and future! How are we restricted to these boundaries? Of course, we are developing but what is the AIM? It can be nothing else 'Nationalism'. Lot of factors work behind nationalism.

So, How researchers are not finding their products in this supportive environment! Why every new digital technology are outcome of western entrepreneurs or researchers? Very few are our own. Why till this time as India such a large country have not even its operating system in computers. We know 'sanskrit' an ancient language which is very acceptable in computer language system. But we have no any research project over this language to generate it as a new computer language. This is the time when Indian computer scientists can give India a new bright face and challenging platform overall. They can change even history. More organizations and researchers should come ahead with their innovations. Modern age startups can also move in this direction. With not only unique products, but also with new widely used products in technology. This so called coming technology would not be only beneficial in day to day life but also should be accepted for studies in Indian universities. So, that Indian product can be widely accepted all over the world. This will make India to approach as with new strong hands in front of the world.

Every Indian student should once go through SWOT analysis of his/her ability in his life to make their career.

## **Politics driven:-**

We are very knowledgeable, but why we cannot choose politics as a career in life although we know what can be the exposure of money and power in this sector! Coming to the context of India. Indian politics are many times deeply rooted in the state of Bihar. If we consider “Gandhi’s movement” of Paschim Champaran before independence and “Jayprakash Andolan” after independence during emergency, every time Bihar plays an important role. Patliputra was also the capital of ancient India also known as Magadh a very much developed dynasty. Bihar is also referred as laboratory of Indian politics these days. But why Bihar, it is because still Biharis are on last bench of any development scale in Indian context. And we have largest population after UP. So, everytime we (Bihari politicians) act as catalyst in Indian politics framework. Now coming to country after this introduction. We are from the land of different kingdoms spreaded all over the country. So, our country is made up of different ambitions and powers. And it makes a heterogeneous situation all over the country which is a tedious mark for unity in India. We are united as so called one nation but are our ambitions united for the same country! But why having with so much resources, a number of people are below povertyline? Is this not a system drawback! We are on the path of sick political system network. It is because we should consider politics is only for well being of public, not for only win and lose driven political system.

What can be a better way to solve poverty at an individual level? Actually poverty is not an individual problem. It is a theory of relation between demand (population) and supply (resources). We might come to the conclusion that how this balance can be maintained! Poverty is a social problem whose solution is not only to generate merely an income source for every individual and sit back but needs to solve the problem at many angles.

Even it might needs a family point of view to how to become get rid from this problem and become wealthy with other than traditional sources of income. In this way Aim of India can be achieved. You can see this pattern how the difference between eastern india and western part of india do for their living! We cann't ignore government policies in deciding a state's future. As the rules and regulations are different in different states of the country. So, how can a single mandate can come for removal of poverty! Policies can easily solve social issues and can make a change in socio-economic structure of a society and state. Obviously, there are only two options a government or political parties can choose to take a lead. First is by rising above than it's own political future and serve for social well being and second is which is mostly used by choosing 'political wellness' by putting social wellness aside. A country's future can highly impacted by political agendas. So, we found there can be a process of two way interaction where people interacts with political system and can make a better political composition. It is not only our duty but it should be on priority basis too for a country like india.

## **Sports driven**

A healthy body and mind is very much needed to take right decision. A healthier society has greater scope. They can take strong and right decisions in every aspects of living. Sports are not only a sector of various games , but now a days it is a platform for big career too. We can find our role players among the faces of good sportspersons. If we take sports as a career opportunity then we have a wide and big platform for our life. In other way, a country's reputation can be raised high internally and externally both due to sport's spirit. So, here sky is the limit.

An extraordinary performance of a country for all around can't be assure with neglecting sports as a major approach among other countries.

## **Brain drain driven**

38% of doctors in United States, 36% of scientists at NASA, 34% of Microsoft employees are Indians (according to ministry of HRD, 2008). So, india is facing a problem of migration of highly skilled professionals for last few decades. We think this migration is only through career prospects. But it is a loss of skilled manpower/professionals which are trained in our country by a huge investment in premier institutes. And they work in foreign for the development of those countries. In the context of india, loosing of these kind of professionals is called Brain drain. Government should rethink over it that how this migration can be stopped by giving them much needed compensation and facilities here in India also. These are the reasons that why western countries are far ahead of India in technologies and management both simultaneously and continuously for years. India needs an industrial revolution too to make a competence with developed nations. We need to develop a master policy in indian context where how India can be great or in a category of developed nation in fast pace. So, here startups also come. We can satisfied in life with our startups, one of the good way to earn more than merely a salary. However government needs to take serious steps for revolution.

## **Nationality driven**

As we discussed we are the country of different cultures. So, we are not united as mindset according to different geographical prospects. And after this in india, politics is driven by such system due to number game of population mostly. So, how nationality can grow among people is the big question. Merely to celebrate independence day is not a big kind that we are patriotic. And without the factor of nationalism, a country cannot develop in right manner.

Here politics is also compelled due to the factor of number of votes and system, but politicians should realize that there is a way where some tough decisions and sacrifices are needed in interest of the country. These tough decisions will make the country strong and united where nationalism can grow. In current scenario we are divided according to geographical boundaries and prospects. If we have no any same vision in interest of our country then how nationalism can evolve? In context of our country, have we ever thought, what are our responsibilities for our country! It starts from a person of government to the last person of public that all are 'Indians' first. So, we should keep the priority of our nation first, then only we can hope for united prospects within the nation. And government responsibility that it should be strict by keeping this nationalism spirit in every individual.

There are some other ways from where we can digout for the nationalism. This we can learn from our neighbor country china and their policies. China made themselves asia's most powerful country in recent decades. China is such a country which has the capacity to beat western countries too. How this happened? This is due to rules and regulations which china followed and the policy of nationalism above all. Like their industrial revolution with Public-Private partnership for wellbeing of policy and structure of society. In the same way India should realize that how we can move great ahead of all and what are loopholes in policies which are restricting india on back foot. Lots of factors are working, but we and government should understand for better nationalism spirit and good governance India still needs revolution. And people should keep their personal prospects after wellness of national prospects and nationalism.

*“We should not sit back, Reformation of India is not an individual problem may be on political platform or technological, come together out from personal agendas”*

Thanks
